

Pilot data processing addendum

De-identified operational-data handling

Issue date: 2026-05-04

Prepared by: Daniel Panea Lichtig

Synthetic business document generated for the Private Company Memory Demo. All companies, people, domains, and scenarios are fictional and any resemblance to a real engagement is unintended.

Purpose

The pilot processes de-identified operational notes, schedules, and meeting transcripts to improve the briefings clinical operations leads prepare before regional reviews. The intended use is to summarise workflow context, surface open follow-ups, and link claims back to specific source artifacts.

The pilot is explicitly framed as operational support. It is not a clinical decision support tool and does not produce diagnoses, treatment plans, or any recommendation that would substitute for clinical judgement. Clinical staff retain full authority and accountability for clinical decisions.

This addendum sits alongside the pilot proposal and applies for the duration of the evaluation. Any decision to move beyond the pilot will be governed by a separate services agreement and a new data processing addendum scoped to the production use case.

Excluded data

Patient-level clinical records, diagnostics, treatment plans, and any direct identifiers (full name, national identifier, contact details, date of birth, address) are out of scope for the pilot.

Where operational notes incidentally reference patient information, those notes are excluded from ingestion at the source. Where exclusion is impractical at the source, the relevant fields are redacted before the artifact enters the raw store. Redaction is performed by Caldrisa-named personnel using an agreed redaction guide.

Free-text fields that may contain incidental personal data are subject to spot-check audits during the pilot. Any artifact found to contain in-scope-excluded data is removed from the raw store, the embedding index is rebuilt, and a short note is added to the pilot evidence pack documenting the removal.

Retention

Pilot source files are retained only for the evaluation period and for up to thirty days after the pilot ends to allow the joint readout, unless Caldrisa explicitly approves a written extension. After this window, the raw store and the derived retrieval index are deleted.

Retention applies equally to raw artifacts, derived AI-ready documents, embedding vectors, and any cached evaluation outputs. Log files used for operations and audit are kept for the same window unless a longer retention is required to investigate an incident.

Deletion

Deleted source artifacts are removed from the raw store and the retrieval index is rebuilt so the removed content is no longer surfaced in retrieved context. Deletion requests can be submitted by Caldrisa's named compliance contact and are acknowledged within five business days.

End-of-pilot deletion is performed by the Architect, witnessed by Caldrisa's compliance contact, and confirmed in writing. A short deletion report is added to the evidence pack and shared with both parties.

If a request to delete a specific artifact arrives during the pilot, that artifact is removed within five business days, with the index rebuild completed in the same window. Where retrieval has already produced an answer that cited the removed artifact, that answer is annotated so reviewers understand the source is no longer available.
