

Vendor contract summary

Document processing and hosted model service boundaries

Issue date: 2026-05-06

Prepared by: Daniel Panea Lichtig

Synthetic business document generated for the Private Company Memory Demo. All companies, people, domains, and scenarios are fictional and any resemblance to a real engagement is unintended.

Summary

The document processing vendor contract covers OCR rendering, PDF page image storage, and hosted embedding/model API access used only for synthetic public-demo traffic and approved pilot environments. It does not authorize the vendor to train on customer content, resell source artifacts, or retain prompts beyond the operational logging window.

The current commercial term runs through the end of August 2026. Renewal should not be automatic: Procurement wants a written review of usage, incident history, and export feasibility before extending the service.

Security and data handling

The contract requires encrypted transport, EU-region processing for approved pilot workloads, and deletion of raw processing queues within thirty days. Debug logs may contain file names and processing metadata, but they must not contain full prompt text, full extracted documents, or model responses at INFO level.

Production client data remains out of scope for the public demo. A paid pilot may use the same vendor only after the client approves the subprocessor list and the deployment notes explain which artifacts leave the client's infrastructure.

Commercial terms

The contract is usage-based with a monthly cap. Daniel reviews spend weekly during live demos and can disable hosted calls if daily budget alarms trip. The contract allows export of derived indexes and raw artifacts without penalty if the architecture moves to a sovereign self-hosted path.

The next procurement decision is due by 2026-08-31. The open question is whether hosted embeddings remain acceptable for private walkthroughs, or whether all paid pilots should default to the vLLM deployment path.

Decision notes

The vendor is acceptable for the public reference demo because the corpus is synthetic and the architecture clearly labels the hosted dependency. It is not a blanket approval for client data.

If a prospect asks for strict sovereignty, the response should point to the documented vLLM path and explain the trade-off: higher operational burden, lower third-party exposure, and more hardware planning before launch.
